

Bee Trio Trackers

Beyond Boundaries , Delivering Smiles

A courier tracking web application designed to help customers monitor parcel deliveries while allowing administrators to manage shipments and update delivery statuses through a centralized system. As my first UI/UX project, it provided hands-on experience in designing user interfaces, organizing information, and creating workflows for both desktop and mobile devices.

ROLE	TOOL	PLATFORMS
UI/UX Designer	Figma	Desktop & Mobile (Designed Separately)

→PROBLEMS

Customers often have limited visibility into the status of their shipments, making it difficult to know where a parcel is or when it will arrive. Courier companies also need an organized system to manage shipments, update delivery statuses, and provide accurate tracking information.

→GOALS

The goal of the project was to:

- Design a simple parcel tracking experience.
- Make shipment information easy to understand.
- Improve transparency throughout the delivery process.
- Design dedicated layouts for both desktop and mobile users.

→TARGET USERS

01 Customers	02 Courier Staff	03 Online Shoppers	04 Businesses
-----------------	---------------------	-----------------------	------------------

→KEY INSIGHTS

During the design process, I focused on making parcel tracking simple and easy to understand.

- Quick Parcel Search** – Allow users to find shipment information using a tracking number.
- Clear Tracking Information** – Present delivery details in a clean and organized layout.
- Simple Navigation** – Help users access important information with minimal effort.
- Desktop & Mobile Design** – Create dedicated interfaces for both desktop and mobile users.

→FINAL UI

→PROTOTYPE

Two interactive Figma prototypes were created to demonstrate the user experience across both platforms. The desktop prototype showcases the complete web interface, while the mobile prototype presents a dedicated mobile experience optimized for smaller screens.

[View Desktop Prototype →](#)

[View Mobile Prototype →](#)

→DESIGN SYSTEM

The interface follows a clean and consistent design system to improve usability and readability.

→CHALLENGES AND DESIGN DECISION

Challenges

As my first UI/UX project, one of the main challenges was organizing tracking information into a layout that was easy to understand. Another challenge was creating separate desktop and mobile designs while maintaining visual consistency across both interfaces.

Decision Outcomes

To address these challenges, I designed a simple navigation structure, created a prominent tracking search section, organized shipment information into clean cards and sections, and used clear status indicators to help users understand delivery progress. I also designed dedicated desktop and mobile interfaces, ensuring each platform provided a straightforward and intuitive experience.

→WHAT I LEARNED

- Learned how to transform user requirements into structured interface designs.
- Improved my ability to create clear information hierarchies for better usability.
- Gained experience designing consistent desktop and mobile interfaces in Figma.
- Developed an understanding of component consistency, spacing, and visual balance.
- Learned how to simplify complex workflows into intuitive user experiences.
- Built a strong foundation in UI design by applying design principles to a real-world project.
